

MR

MANUEL RODRIGUEZ

SUMMARY

Full Stack Engineer working on a network management system used to configure and monitor network switches. Builds frontend features for switch configuration, Ethernet virtual circuit creation, and topology views, backed by REST APIs and real-time events. Designed the frontend flow for real-time updates, keeping the UI in sync with backend system changes.

SKILLS

Frontend

- React, Next.js, Angular
- JavaScript, TypeScript
- Redux Toolkit, Redux-Saga, TanStack Query
- PrimeReact, D3.js
- Responsive UI design, component-driven development

Backend and Integration

- Java, Spring Boot
- REST APIs, gRPC, Netconf

Cloud & Platform

- Kubernetes, Docker, Helm, MicroK8s
- Git, GitLab CI/CD
- Prometheus, Grafana, Loki

Architecture & Practices

- Event-driven architecture
- Frontend architecture and state management
- Agile / Scrum

EDUCATION

B.S

Computer Engineering
California State University Northridge,
Northridge

EXPERIENCE

FRONTEND SOFTWARE ENGINEER

Canoga Perkins | Chatsworth, USA | April 2022 - Current

- Proposed and drove the adoption of **Next.js** on top of React to provide a structured application framework, defining standards and conventions that aligned frontend development across the team
- Introduced a service-layer abstraction for data access, allowing the frontend to switch between live API services and mock implementations, improving testability and accelerating feature development.
- Identified duplicated data-fetching logic across the frontend and introduced **TanStack Query** to standardize loading, error, and caching behavior, reducing boilerplate and simplifying asynchronous state management.
- Led the implementation of real-time UI updates by wiring Kafka-driven service events into Redux and saga middleware, automatically refreshing tables and topology views to keep the application in sync with backend state.
- Implemented a backend provider and subscriber-based architecture in **Java** to monitor device state changes, persist updates, and emit corresponding **Kafka** events for create, update, and delete operations consumed by the frontend.

- Introduced a centralized exception-handling strategy using **Spring Controller Advice**, standardizing error responses and improving reliability across multiple backend microservices.
- Investigated and resolved instability in a backend connectivity service, identifying the root cause of intermittent disconnects and improving overall service reliability.
- Drove the implementation of a topology feature using **React Force Graph**, visualizing device connections and providing operators with a clear, interactive view of switch connectivity.
- Built and maintained a reusable UI component library using **PrimeReact**, improving UI consistency and development efficiency across the application.
- Introduced an observability stack using **Grafana, Loki, and Prometheus**, integrating it into the Helm-based solution chart to provide centralized logging and monitoring for the network management platform.
- Mentored and onboarded engineers, promoting frontend architecture standards, improving code quality, and accelerating ramp-up across the team.

FRONTEND SOFTWARE ENGINEER

J.D. Power | Westlake Village, USA | October 2015 - April 2022

- Maintained and enhanced a legacy **AngularJS** analytics application by resolving production issues and implementing new features to support evolving business requirements.
- Led the migration of a legacy AngularJS application to modern **Angular (2+)**, modernizing the codebase and improving maintainability and long-term scalability.
- Developed backend APIs in **Java** using **JPA** and **Hibernate** to support create, read, update, and delete operations, integrating with an Oracle database to persist application data.
- Developed a **Spring Boot** API to process IP address data collected during user sign-in, enabling reporting and analysis to detect potential credential sharing and suspicious access patterns.
- Used **MicroStrategy's** custom SDK to build a custom authentication form, integrating with backend REST APIs to capture sign-in metadata (such as IP address and user context) for security analysis and reporting.
- Developed **custom plugins** to extend MicroStrategy, enabling company-specific branding and UI customization on top of the analytics platform.
- Integrated **Firebase** push notifications into a **React Native** application, improving user engagement and enabling real-time communication.

PROJECTS

Personal Portfolio Website (Angular 19)

- Designed and developed a component-driven portfolio using **Angular 19** and **PrimeNG**, showcasing professional experience and projects.
- Implemented responsive layouts and reusable UI components following Angular best practices.

- Emphasized performance, maintainability, and accessibility to deliver a polished, production-quality user experience.

E-Commerce Application (Next.js 13)

- Built a full-stack e-commerce application using **Next.js 13** (App Router) and **TypeScript**.
- Implemented product listings, shopping cart functionality, and a complete checkout flow.
- Integrated **Stripe** Checkout and **webhooks** to handle secure payments and order confirmation.
- Applied modern data-fetching and state management patterns to support a scalable and maintainable architecture.
